

Ideas

- Augmented reality - point camera towards a house and it shows the info.
- Pokémon Go sort of thing to add to saved houses
- Shows house stats, even if not for sale - # of bedrooms, baths, sq footage, lot size, (what's it worth - estimate? - range from different sites or Zestimate or average?)
- Houses on sale - stats show as different color stats box/flag. Gray box for houses not on sale
- Add logo for which company the house is listed on
- Builds a map of saved houses
- Neighborhood info, for large communities first. Local schools and quality.
- Add school bus routes, public transit, other
- Map like a gps with houses for sale in your area on any platform (Redfin, Zillow, others)
- Kind of like Waze. To drive around a town to discover what's on sale. With signs at the ends of roads like realtors put up.
- Point at a single property with the camera for 5 seconds and it will auto pull up the listing
- Saving house on a dream house list so you get notified if it comes on sale
- Different tabs for the different functions

Questions

- How could this interplay with realtors and listings?
- How does this work with condos or many unit apartments? Or in cities in general?
- What other improvements to the process would increase the buyers experience?
